Question # 3

Tell me What is the difference between SQL Object and SQL Exec?

Answer:-

SQL Object is a peopletool definition which can be created using app designer as well as using peoplecode command CREATSQL() , it is mainly used for reuseability of the sql statements. so whenever this statement is required no need to hard code, just create an sql object of the same and use where ever it is required. sqlxec is a peoplesoft delivered function used to retrieve only one row and u can update multiple rows of data. It directly interacts with the database.

Question # 8

How to comment out a piece of the peoplecode in a program?

Answer:-

REM can be used to comment a single line, but it will be processed by the comp. processor;

Single and multiple line commenting:

```
/* PeopleCode stmts
```

```
-----
```

```
*/
```

Nested Comments:

```
<*
```

```
/* PC Stmt ..... */
```

```
/* ..... Some info on code ..... */
```

```
/* More comments */
```

```
*>
```

Question # 9

Tell me What is the diff between component level peoplecode and record level peoplecode?

Answer:-

Record Level peoplecode:

The peoplecode written on the Record level Peoplecode will affect all the Components in which that particular record is used, and if we want to execute the record peoplecode for particular Component then we would need to add following code in before existing peoplecode

```
If %component = component.<Component Name> [statement_list_1]
```

```
[Else
```

```
[statement_list_2]]
```

```
End-If;
```

Component Level Peoplecode:

The component level Peoplecode works only for that particular component and if any record in the component is referenced by component level peoplecode then it would not effect any other component where same record is used as it was doing in above case.

Sequence: first Record level peoplecode will fire and then Component level peoplecode.

As far as sequence is concerned

Question # 15

Explain the advantage and disadvantage of sqlxex in peoplecode?

Answer:-

By using SQLExec function we can do the manipulation to the database. we can write insert,update,delete sql commands. But drawback while selecting the data using sqlxex, it will return only one at a time. another drawback, if the name of the records changed, then you have to make the changes in the code as the query will in the quotes inside sqlxex

[Read More Answers.](#)

Question # 16

Can you explain about component Buffer?

Answer:-

When you open any page in a component, the system retrieves all of the data records for the entire component and stores them in one set of record buffers, organized by scroll level and then by page level. This component buffer consists of rows of buffer fields that hold data for the various records that are associated with page controls, including the primary records; related display records, derived work records, and translate table records.

PeopleCode frequently must refer to data in the Component Buffer, that is, the area in memory that stores data for the currently active component.

There are two methods of specifying a piece of data in the Component Buffer from within PeopleCode:

----- Contextual references, which refer to data relative to the location of the currently executing PeopleCode program.

----- References using scroll path syntax, which provide a complete, or absolute, path through the Component Buffer to the referenced component.

The component buffer contain current active component data it is temporary memory area .

Question # 19

Tell me Is there any function exist in peoplecode which stops the processing of whole component?

Answer:-

i think, it is "Error" Function. Use the Error function in FieldEdit or SaveEdit PeopleCode to stop whole processing and display an error message. It is distinct from Warning, which displays a warning message, but does not stop processing. Error is also used in RowDelete and RowSelect PeopleCode events.
