want to query a data model, such as RDF, and not the XML syntax of a representation of that data model. However, please note that the authoratitive interpretation of the fragment identifier is determined by the Internet Media Type. If you want to opt-in for XPointer, then you can always create publish your own Internet Media Type with IANA and specify that it supports the XPointer Framework for some kind of non-XML resource. In this case, you are going to need to declare your own XPointer schemes as well

#### Question #8

How you can enhance your XSL test?

#### Answer:-

There are variety of options to enhance your test: (1) You can add checkpoints to your test. A checkpoint is a step in your test that compares the values of the specified property during a test run with the values stored for the same test object property within the test. This enables you to identify whether or not your Web site or application is functioning correctly. (2) You can parameterize your test to replace fixed values with values from an external source during your test run. The values can come from a Data Table, environment variables you define, or values that QuickTest generates during the test run. (3)You can retrieve values from your test and store them in the Data Table as output values. You can subsequently use these values as an input parameter in your test. This enables you to use data retrieved during a test in other parts of the test. (4) You can divide your test into actions to streamline the testing process of your Web site or application. (5)You can use special QuickTest options to enhance your test with programming statements. The Step Generator guides you step-by-step through the process of adding recordable and non-recordable methods to your test. You can also synchronize your test to ensure that your application is ready for QuickTest to perform the next step in your test, and you can measure the amount of time it takes for your application to perform steps in a test by defining and measuring transactions. (6)You can also manually enter standard VBScript statements, as well as statements using QuickTest test objects and methods, in the Expert View.

# Question # 12

What is the terms Test Object Model, Test Object and Run-Time object?

# Answer:-

The test object model is a large set of object types or classes that QuickTest uses to represent the objects in your application. Each test object class has a list of properties that can uniquely identify objects of that class and a set of relevant methods that QuickTest can record for it. A test object is an object that QuickTest creates in the test or component to represent the actual object in your application. QuickTest stores information about the object that will help it identify and check the object during the run session. A run-time object is the actual object in your Web site or application on which methods are performed during the run session.
